

AI Log

9/28/2026 - 12:12PM

c:\Github Desktop\DunkirkCybersecurityGame\Rulebook Demo\index.html

make it so that @"Rulebook Demo/" does not need to be hosted to be seen by changing @"Rulebook Demo/pages/" so they aren't text files; integrate them into the code;

9/28/2026 - 12:20pm

move the rulebook icon left towards the steering wheel more so that it is centered between the steering wheel and the log dial.

9/28/2026 - 12:35PM

Make it so when you are zoomed into the telex message after clicking on it, the rule book's spine is the size of the right side of the screen peeking out. Make the spine say "RULEBOOK". If the rulebook is clicked on that screen, open the rulebook and put the telex message next to it; make a "close rulebook" button in this window.

9/30/26 - 10:19PM

Now do the exact same thing but for the binoculars.

9/30/26 - 10:37PM

We are creating a 10 minute long game from the POV of a sailor who was drafted to help with the WW2 Dunkirk operation. This is for 8th grade - 10th grade to teach them about cybersecurity concepts. The goal is to navigate to dunkirk beach using deciphered information you get. I need you to create dialogue for this game, and then create me a prompt to have AI create a timing system in the image above and make the program flow like a game with the dialogue you created.

0/30/26

You are an experienced game programmer helping a student team build a 10-minute educational game in [ENGINE / LANGUAGE, e.g. Unity C#, Godot GDScript, JavaScript + HTML canvas]. The audience is grades 8-10. Write clean, well-commented code that students can read and modify.

GAME SUMMARY

The player skippers a small boat from Ramsgate to Dunkirk in 1940. Orders arrive by telex as Caesar-cipher messages. Some are fake. The player checks each one against a rulebook (stamp, cipher key, codeword), marks it TRUST or REJECT, and steers with a wheel and compass. A crewmate, Tom, comments through dialogue. Binoculars let the player spot buoys and identify planes. There is NO map.

WHAT I NEED YOU TO BUILD

1. Game clock

- 600 real seconds = 10 in-game hours. Display in-game time as HH:MM, starting 05:00 and ending 15:00 (1 real second = 1 in-game minute).
- The clock is paused during the intro (Act 0) and on ending screens, and runs during the voyage.
- Include a debug option to speed up time (x2, x5) and to jump to a given time, so we can test quickly.

2. Dialogue dataset

- Convert the script I paste below into a data file (JSON or the engine's equivalent), one entry per line, using this shape:

```
{ id, speaker, text, mode, duration, trigger: { type: "time" | "event", value }, onShow?, choices? }
```
- mode is one of: CLICK, AUTO, AUTO_CLICK, TELEX. duration is in seconds for AUTO and AUTO_CLICK.
- Telex entries also need: stamp ("genuine" | "eagle" | "no_crown" | "none"), ciphertext, key, correctAction ("trust" | "reject"), and optionally newHeading.
- Keep all text in the data file, never hard-coded in scripts, so writers can edit dialogue without touching code.

3. Dialogue manager (the timing system)

- CLICK: the line stays until the player clicks or presses Space.
- AUTO: the line disappears after its duration.
- AUTO_CLICK: the line disappears after its duration, or earlier on click.
- If a line has no duration, calculate one: 2 seconds + 0.3 seconds per word, minimum 3 seconds.
- Show text with a typewriter effect; a click while typing finishes the line instantly instead of skipping it.
- Lines never overlap. Use a queue. If a new line triggers while another is showing, it waits its turn.
- Event-triggered feedback lines (like Tom reacting to a REJECT) jump to the front of the queue.
- Drop stale time-triggered chatter if it has waited in the queue more than 10 seconds, but never drop TELEX entries or story-critical lines.
- The voyage clock keeps running while dialogue is on screen; only CLICK lines in the intro and endings pause it.

6. Endings

- Victory: route progress reaches 100% before 15:00.
- Out of time: the clock reaches 15:00.
- Lured south: heading south for more than [NUMBER] continuous seconds after trusting TX-02 or TX-06.
- Turned back: heading west for more than [NUMBER] continuous seconds after trusting TX-04.
- Show the matching ending lines and a score: telexes judged correctly out of 8, sightings correct out of 4.

7. Game flow (state machine)

TITLE -> INTRO (Act 0, clock paused) -> VOYAGE (clock running, timed and event triggers) -> ENDING -> back to TITLE with a Restart option. Restart must fully reset the clock, queue, log, rulebook, and score.

8. Rename (script)

Rename the characters to match the rulebook and telex machine. Change things from the script i'm giving you to match what is already built in the program.

9. RULES!!!

DO NOT CHANGE THE FUNCTIONALITY OF ITEMS IN THE GAME!!! All of this was written without any reference to the actual code, so feel free to change this stuff i'm asking for (including the dialogue) Also put all of this in @Script

DELIVERABLES

- A short plan of the scripts/files you will create and what each does, before writing code.
- The code for each file, with comments explaining the timing logic.
- The full dialogue data file built from my script.
- A short test checklist we can follow to confirm every trigger fires at the right time.

Ask me questions first if anything about my engine or setup is unclear.

None

10/01/26 - 11:05AM

I don't want the characters to walk the player through so much... I want the player to have to think and figure things out. Change the dialogue accordingly in @Script/[dialogue.js](#)

10/2/26 - 11:30am "Edit the README.md and make it professional. Include acceptance criteria and stuff."

10/2/26 - 11:57pm "Fix all the merge conflicts."

10/3/26 - 12:01am "You didn't remove Avery's work, right? I want them to work together and lose the most minimal amount of stuff."

10/3/26 - 12:02am "I'm working on his branch right now, this is all his work. All of the merge conflicts were from all his hard work."

10/3/26 - 12:04am "I'm trying to merge Avery's branch into main using a pull request but there's so many merge conflicts still. I thought you fixed them?"

10/3/26 - 12:05am "Combine both."

10/3/26 - 12:22am "Still good?"

10/3/26 - 12:28am "Adjust README.md and keep everything on there and add what you need. Make it more professional."

10/3/26 - 12:29am "It's merged."

10/3/26 - 12:31am "Add acceptance requirements and acknowledge known issues."
