|-----------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9/22/2026 | 11:09 PM | I want to make two frames for different planes that can be seen through the binoculars. I want this done in HTML and CSS for a web-based game, I have already made a file for the German plane help me design the scene                                                                                                                                                                                                                                                                                                  |
| 9/22/2026 | 11:22 PM | @ "Ship Functionality Demo/shipbuild-demo.html" can you take the binocular frames and put them over the scene of the British and German plane                                                                                                                                                                                                                                                                                                                                                                            |
| 9/22/2026 | 11:40 PM | On second though I want to see the type of plane on the same horizon the rest of the game views, when the binoculars are clicked and the frame is displayed can I make it so that the plane appears closer and can be identified                                                                                                                                                                                                                                                                                         |
| 9/23/2026 | 12:26 PM | Okay I like the silohette of the plane being visible while steering the boat, I want to keep that as a seperate "silohette" plane that appears randomly while on the boat. The user should spot this silohette and then interact with the binoculars which will then change the silohette to a german or english plane sprite. When the user finds the plane in the binoculars they should be allowed to "Spot" them by clicking on the sprite, which then the plane can fade out as its no longer needed                |
| 9/23/2026 | 12:44 PM | I am only able to click the plane once then when another spawns it doesn't let me select it, Also can you let the plane pause in the air for a second so the user can view it. It also has only used the german sprite                                                                                                                                                                                                                                                                                                   |
| 9/23/2026 | 7:56 PM  | I need the user to be prompted with a question when they click the plane, it should ask whether the plane is german or allied                                                                                                                                                                                                                                                                                                                                                                                            |
| 9/27/2026 | 11:49 PM | @ "Telex Machine Demo/" @ "Ship Functionality Demo/" I want to refine the telex machine so that the page printed disappears after being read, I also want to add a variety of message types primarily plaintext, and cyphers. I want the ciphers to be two pieces that get printed out seperately, the first should be a key needed for a future message. I also need a way to save and select recieved messages for this, add an archieve and give a distinction for all cypher messages probably with a stylized icon. |
| 9/28/2026 | 12:08 AM | I dont want the red stamp on the machine when the paper is printed, it should just be like a typewriter no stamps                                                                                                                                                                                                                                                                                                                                                                                                        |
| 9/30/2026 | 4:42 PM  | @ "Telex Machine Demo/" @ "Ship Functionality Demo/" make it so that when a german plane is spotted the user is prompted to report it to the telex machine by clicking on it. Reply with message like recon sent                                                                                                                                                                                                                                                                                                         |

|           |          |                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9/30/2026 | 10:22 PM | As a player, I want to click and drag/select punchcard elements to decode a cipher, so that I can verify whether a Telex message is legitimate. This should also be where we design telex messages to simulate phishing attempts and prompts and educates the user on security awareness. Sending two messages one as an encryption key and the other as message would also be a good topic of cybersecurity. |
| 9/30/2026 | 10:44 PM | I want the player to always have access to this desk and to place all recieved telegraphs there after being read. Add a filter option so they can find cypher or plaintext messages. Encrypted messages should be kept together with key so the player can veiww both. Add a drag and drop feature as well to let the user play with the arrangement of pages.                                                |
| 9/30/2026 | 11:00 PM | when the telex machine message is read I want the printed paper to be removed from the printer and placed on the desk                                                                                                                                                                                                                                                                                         |
| 9/30/2026 | 11:11 PM | This is more criteria for the punchcard encyption mechanics. (sent with an image of the checklist: "Cipher puzzle is solvable via clicks only (no typing required, given the age range)", "At least one cipher type solvable in under ~60 seconds", "Correct decode reveals true instruction; incorrect decode has a fail-safe")                                                                              |
| 9/30/2026 | 11:49 PM | Can you stack the telex messages that are the same, Such as the recon reported pages. Also I Havent recieved any encrypted or phishing messages yet.                                                                                                                                                                                                                                                          |
| 10/1/2026 | 11:59 PM | I want to add the feature of pausing the game so the user can take a break. The game state should be saved in case the browser refreshes. Make it a simple on screen button in the top left preferably.                                                                                                                                                                                                       |
| 10/2/2026 | 12:10 AM | When the browser gets refreshed, I want the game to rest                                                                                                                                                                                                                                                                                                                                                      |
